FÉMEK

Bármely kategóriája az elektromosan pozitív elemeknek, melyeknek többnyire fényes felületük van, általában jó elektromos- és hővezetők, felolvaszthatók és összeolvaszthatók, vékony lemezekre hengerelhetők vagy drótokba sodorhatók. A tipikus fémek sókat képeznek nemfémekből, oxidokat oxigénből és egymással ötvöződnek.

Az ólomexpozíció és a gyilkossági arány kapcsolata az USA-ban (/100,000)

„Igealkotási” feladat az ólom-expozíció tükrében

Alacsony átlag vér-ólom szint (7.6 $\mu\text{g}/\text{dL}$)

Magas átlag vér-ólom szint (26 $\mu\text{g}/\text{dL}$)

Yuan W, et al. Pediatrics (in press).

Mérgezőnek tekinthető az ólom 10 µg/dL-es vérszint alatt?

“A munkacsoport arra a következtetésre jutott, hogy amíg a rendelkezésre álló bizonyítékok nem engedik meg a végleges okozati magyarázatot a magas vér-ólomszint és a kedvezőtlen egészségügyi mutatók között <10 µg/dL értéknél, az elérhető bizonyítékok súlya támogatja - és nem veti el - azt, hogy ezen összefüggések magyarázata - legalább részben - okozati.

Miért nem változik a vér-ólom határértéke ebben az időszakban?

- Nincsenek tényleges „klinikai” beavatkozások alacsony vér-ólom szintnél gyermekeknél (< 10 $\mu\text{g}/\text{dL}$ -nél)
- A gyermekeket nem lehet osztályozni 10 $\mu\text{g}/\text{dL}$ < vagy > vér-ólomszintenként a laboratóriumi tesztek velejáró pontatlansága miatt
- Nincs bizonyíték a küszöbértékre; így, a biztonságos határérték csökkentése önkényes lenne és bizonytalan előnyökkel szolgálna

NEWS FOCUS

TOXICOLOGY

Overhaul of CDC Panel Revives Lead Safety Debate

Just as an advisory committee began looking at evidence for setting a stricter lead-exposure standard, it got reorganized.

How far should society go in protecting children from exposure to low-level lead? The question, hotly debated in the past, is suddenly back on the front burner. Public health advocates and Democrats in Congress accused the Administration of trying to lead a reorganizational advisory panel with friends of the industry. They suspect that the Administration wants to head off an effort to tighten the definition of lead poisoning. A general spokesperson acknowledges that the panel that advises the Centers for Disease Control and Prevention (CDC) in Atlanta is getting new members. But he denies that the Administration has any policy in mind and says that the new panelists are well qualified.

The changes to CDC's Advisory Committee on Childhood Lead Poisoning Prevention are the latest of several that have raised concerns about scientific advice (see Editorial, p. 703). This change comes at a critical time for the committee: It is examining studies that show that lead is harmful below the allowed level of 10 micrograms per deciliter of blood. If the panel decides that a smaller amount of lead is harmful, it could recommend lowering exposure. This would prompt tighter cleanup regulations that would be expensive for the lead industry and owners of housing with lead paint to implement.

The CDC changes also come at a time in litigation over lead's toxicity in Rhode Island, following the model of that state's tobacco industry, is suing paint producers to recover the cost of removing lead-painted buildings. Some 10 million U.S. housing units still had lead paint in the late 1990s, according to a survey. Lowering the level deemed safe would increase the number of children and probably boost damage claims.

In the 1960s, doctors diagnosed lead poisoning if the blood level was above 50 µg/dl, exposure that can cause serious

5 µg/dl. CDC seemed agreeable: The *St. Louis Post-Dispatch* last summer quoted Richard Jackson, head of the CDC division that deals with childhood lead toxicity, as predicting that the committee would recommend lowering the lead standard and CDC "would go along."

But Jackson isn't commenting now. And the Administration's critics see the latest committee changes as a reversal. The CDC's advisory panel overhaul was documented by an environmental group, the Natural Resources

EDITORIAL

An Epidemic of Politics

Americans have come to accept the role of politics in the appointment of certain kinds of public officials. Few of us are surprised, though some may be disappointed, when a federal judgeship is awarded because the candidate passes a litmus test of loyalty to some principle important to the president's party. Scientific appointments, however, should rest on more objective criteria of training, ability, and performance—at least, that's what this community has always believed. Thus we can view with relative calm the interrogation of a future secretary of Health and Human Services (HHS) about his views on abortion. But it seems out of place when appointees to scientific advisory committees are subjected to tests of political loyalty. And study section membership, which involves peer review of scientific proposals, surely ought to be free of such barriers to entry.

During the past fall, *Science* published several news stories related to this practice. One involved the wholesale replacement of members of the advisory committee to the Centers for Disease Control and Prevention's (CDC's) National Center for Environmental Health, without consultation with the center's director. Another involved CDC's Advisory Committee on Lead Poisoning and Prevention. Still another covered the National Human Research Protections Advisory Committee and the Advisory Committee on Genetic Testing. Perhaps most telling was the reexamining of the membership of the study section that evaluates grants for the study of workplace injuries for the National Institute of Occupational Safety and Health. Advisory committees might have been vulnerable to occasional stacking of this kind in the past, though it is a bad idea. But study sections?

The present epidemic, in which advisory committees are shut down and reassembled with new members, and candidates are subjected to loyalty tests, seems old hat to some observers. "After all, that's fairly standard practice," we have been told by officials in HHS. Well, it isn't—or at least it wasn't. What's unusual about the current epidemic is not that the Bush administration examines candidates for compatibility with its "values." It's how deep the practice cuts; in particular, the way it now invades areas once immune to this kind of manipulation.

In this space in the 25 October 2002 issue, *Science* published an editorial by David Michaels and a group of colleagues. Several were distinguished former public servants who had been involved with some of the committees in question, and they brought a useful personal-experience perspective to the matter. Their piece was a story in itself, but what followed was even more interesting. It loosed a volley of letters to us in which scientists told of similar experiences. Here are two examples:

A nominee for the National Institutes of Health Muscular Dystrophy Research Coordinating Committee is vetted by a staffer from the Office of White House Liaison, Health and Human Services. After being asked about her views on various Bush administration policies, none of them related to the work of the committee, she is asked whether she supports the president's embryonic stem cell policy.

A distinguished professor of psychiatry and psychology receives a call from the White House about his nomination to serve on the National Council on Drug Abuse. His interviewer declares that he must vet him to "determine whether he held any views that might be embarrassing to the president." A series of questions follows, into which the interviewer interpolates a running score, viz: "You're two for three; the president opposes needle exchange on moral grounds regardless of the outcome." He then asks whether the candidate had voted for Bush, and on being informed that he had not, asked: "Why didn't you support the president?"

This stuff would be prime material for a Robin Williams comedy skit, but it really isn't funny. The purpose of advisory committees is to provide balanced, thoughtful advice to the policy process; it is better not to put the policy up front. As for study sections, deciding which research projects to support has always been a matter for objective peer review. Political preferences are for the pork barrel, and the Congress is already doing too much of that. Indeed, the applicable statute for all this—the Federal Advisory Committee Act—specifically requires that committees be balanced and "not inappropriately influenced by the appointing authority." It would be a good idea for HHS Secretary Tommy Thompson and the White House Personnel Office to read the law, and then follow it.

Donald Kennedy

Scientific appointments should rest on more objective criteria.
